Titles in the Series

M. A. Khan and N. C. Yannelis (Eds.)
Equilibrium Theory
in Infinite Dimensional Spaces

*C. D. Aliprantis, K. C. Border
and W. A. J. Luxemburg (Eds.)*
Positive Operators, Riesz Spaces,
and Economics

D. G. Saari
Geometry of Voting

C. D. Aliprantis and K. C. Border
Infinite Dimensional Analysis

J.-P. Aubin
Dynamic Economic Theory

M. Kurz (Ed.)
Endogenous Economic Fluctuations

J.-F. Laslier
Tournament Solutions and Majority Voting

*A. Alkan, C. D. Aliprantis and N. C. Yannelis
(Eds.)*
Theory and Applications

J. C. Moore
Mathematical Methods
for Economic Theory 1

J. C. Moore
Mathematical Methods
for Economic Theory 2

M. Majumdar, T. Mitra and K. Nishimura
Optimization and Chaos

K. K. Sieberg
Criminal Dilemmas

M. Florenzano and C. Le Van
Finite Dimensional Convexity
and Optimization

K. Vind
Independence, Additivity, Uncertainty

T. Cason and C. Noussair (Eds.)
Advances in Experimental Markets

F. Aleskerov and B. Monjardet
Utility Maximization. Choice and Preference

N. Schofield
Mathematical Methods in Economics
and Social Choice

*C. D. Aliprantis, K. J. Arrow, P. Hammond,
F. Kubler, H.-M. Wu and N. C. Yannelis (Eds.)*
Assets, Beliefs, and Equilibria
in Economic Dynamics

D. Glycopantis and N. C. Yannelis (Eds.)
Differential Information Economies

*A. Citanna, J. Donaldson, H. M. Polemarchakis,
P. Siconolfi and S. E. Spear (Eds.)*
Essays in Dynamic
General Equilibrium Theory

M. Kaneko
Game Theory and Mutual Misunderstanding

I dedicate this book to my wife Svetlana and my daughter Margaret, with a provision that she will read it when she grows up.

Acknowledgement

This work was supported by the Melbourne University faculty research grant, FRG04. I am grateful to Peter Bardsley and Rabee Tourky for the comments on the first draft of the manuscript and students who took my Mathematical Economics class and spotted several typos in the text. All remaining mistakes are mine own.

Preface

In many industries the tariffs are not strictly proportional to the quantity purchased, i. e., they are nonlinear. Examples of nonlinear tariffs include railroad and electricity schedules and rental rates for durable goods and space. The major justification for the nonlinear pricing is the existence of private information on the side of consumers. In the early papers on the subject, private information was captured either by assuming a finite number of types (e. g. Adams and Yellen, 1976) or by a unidimensional continuum of types (Mussa and Rosen, 1978). Economics of the unidimensional problems is by now well understood.

The unidimensional models, however, do not cover all the situations of practical interest. Indeed, often the nonlinear tariffs specify the payment as a function of a variety of characteristics. For example, railroad tariffs specify charges based on weight, volume, and distance of each shipment. Different customers may value each of these characteristics differently, hence the customer's type will not in general be captured by a unidimensional characteristic and a problem of multidimensional screening arises. In such models the consumer's private information (her type) is captured by an m -dimensional vector, while the good produced by the monopolist has n quality dimensions.

Recent years witnessed a considerable progress in the area of multidimensional screening. The most important papers are Armstrong (1996), Rochet and Chone (1998), and Basov (2001, 2002, 2004). multidimensional screening models can have fruitful application in the theory of industrial organization, labor markets, and the optimal taxation. For an example of the latter, see Shapiro (2001). However, despite the wide prevalence of non-

linear tariffs and practical importance of understanding the economics that underlies them, this literature remains unknown to the most economists, beyond a circle of a few specialists in the area. In my view, the main obstacle to understanding of this literature is its use of mathematical tools, which are not a part of a standard economist's toolbox. This book attempts to remedy the situation.

I assume that the reader is familiar with basic mathematical tools used by in modern economic theory, such as calculus, linear algebra, elements of the theory of ordinary differential equations, the basics of the measure theory (so I use without a definition such terms as a Borel set, Lebesgue measure, or a Lebesgue measurable function), and the optimal control. I also assume knowledge of microeconomics at the level of Mas-Colell, Whinston, and Green (1995). However, I introduce all more advanced techniques.

The first part of this book contains a review of vector calculus, theory of partial differential equation of the first and second order, and the theory of generalized convexity. These techniques are extensively used in the multidimensional screening models. It also contains a chapter of miscellaneous techniques, which are some times useful in screening models, but are not used as extensively. When the results can be found in easily accessible literature I usually formulate them without a proof, referring the reader to another source. I, however, provide more thorough discussion of the results that are harder to access in the literature.

Part two is devoted to the economics of screening models. It starts with a detailed discussion of economics and mathematics of unidimensional screening problems and three approaches to their solution: direct, dual, and Hamiltonian. It uses the Hamiltonian approach to unify all known results, which were previously obtained using different arguments.

After a thorough discussion of the unidimensional case I move on to the multidimensional screening model. First, I discuss the main economic constraint, which makes the multidimensional case qualitatively different from the unidimensional one: path independence of information rents. I show that it significantly restricts usefulness of the direct approach in the multidimensional case. Dual approach can be taken somewhat further, but it also breaks down, when the dimensionality of type and the number of the screening instruments differ. Hamiltonian approach, however, can be applied fruitfully even in this case. For the most part of the book I, following almost all the literature in the area, assume that the consumer's utility is quasilinear in money. However, in Chapter 8 I go beyond the quasilinear case and provide some results, which apply to a more general specification. I also argue that is some applied models that arise the most natural specification is not quasilinear.

The final chapter concludes and outlines some directions for the future research. One of them, already mentioned, is going beyond the quasilinear case. Another is to look at screening models with finitely many goods and an infinitely dimensional type. I argue that this is probably the most relevant

case from the economic point of view and give some thoughts how the techniques developed in the book can be adapted to handle it.

Each chapter, except for the last one, is followed by exercises. That makes the book useful for instructors, who wish to use it to teach an advanced graduate course in multidimensional mechanism design. Exercises are also important for the general reader, since they allow to develop mathematical and economic intuition and provide deeper understanding of the theoretical facts. Though this book should be sufficient to teach the reader all main mathematical techniques in the area of the multidimensional screening, I provided bibliographic notes in the end of each chapter, so an interested reader can achieve a deeper understanding of the material covered in the chapter and investigate the connections with a broader mechanism design perspective.

I hope that collecting necessary technical tools and economic insights of the multidimensional screening literature in one volume will facilitate the use of the results by applied economists and help to shed some light on many areas of economic theory.

Contents

I	Mathematical Preliminaries	1
1	Vector Calculus	3
1.1	The Main Operations of Vector Calculus: <i>div</i> , <i>grad</i> , and Δ	3
1.2	Conservative Vector Fields	5
1.3	Curvilinear Integrals and the Potential	7
1.4	Multiple and Repeated Integrals	8
1.5	The Flow of a Vector Field and the Gauss-Ostrogradsky Theorem	12
1.6	The Circulation of a Vector Field and the Green Formula .	15
1.7	Exercises	16
1.8	Bibliographic Notes	18
2	Partial Differential Equations	19
2.1	The First Order Partial Differential Equations	19
2.1.1	The Complete Integral and the General Integral . .	20
2.1.2	The Singular Integral	21
2.1.3	The Method of Characteristics	22
2.1.4	Compatible Systems of the First Order PDEs	24
2.1.5	The Method of Characteristics for a Non-quasilinear First Order PDE	26
2.1.6	Examples	27
2.2	The Second Order Partial Differential Equations	30

2.2.1	Linear Second Order Partial Differential Equations	30
2.2.2	Boundary Value Problems for Elliptic Equations	31
2.2.3	Examples	32
2.3	Group Theoretic Analysis of Partial Differential Equations	38
2.3.1	One Parameter Lie Groups	38
2.3.2	Invariance of PDEs, Systems of PDEs, and Boundary Problems under Lie Groups	41
2.3.3	Calculating a Lie Group of a PDE	44
2.3.4	Calculating Invariants of the Lie Group	45
2.3.5	Examples	46
2.4	Exercises	47
2.5	Bibliographic Notes	49
3	Theory of Generalized Convexity	51
3.1	The Generalized Fenchel Conjugates	52
3.2	Generalized Convexity and Cyclic Monotonicity	55
3.3	Examples	58
3.4	Exercises	59
3.5	Bibliographic Notes	60
4	Calculus of Variations and the Optimal Control	61
4.1	Banach Spaces and Polish Spaces	61
4.2	Hilbert Spaces	65
4.3	Dual Space for a Normed Space and a Hilbert Space	66
4.4	Frechet Derivative of a Mapping between Normed Spaces	69
4.5	Functionals and Gateaux Derivatives	71
4.6	Euler Equation	73
4.7	Optimal Control	74
4.8	Examples	76
4.9	Exercises	78
4.10	Bibliographic Notes	79
5	Miscellaneous Techniques	81
5.1	Distributions as Solutions of Differential Equations	81
5.1.1	A Motivating Example	82
5.1.2	The Set of Test Functions and Its Dual	83
5.1.3	Examples of Distributions	84
5.1.4	The Derivative of a Distribution	87
5.1.5	The Product of a Distribution and a Test Function and the Product of Distributions	88
5.1.6	The Resultant of a Distribution and a Dilation	89
5.1.7	Adjoint Linear Differential Operators and Generalized Solutions of the Partial Differential Equations	91
5.2	Sobolev Spaces and Poincare Theorem	92
5.3	Sweeping Operators and Balayage of Measures	94

5.4 Coercive Functionals 96
 5.5 Optimization by Vector Space Methods 96
 5.6 Calculus of Variation Problem with Convexity Constraints 98
 5.7 Supermodularity and Monotone Comparative Statics 99
 5.8 Hausdorff Metric on Compact Sets of a Metric Space 103
 5.9 Generalized Envelope Theorems 107
 5.10 Exercises 109
 5.11 Bibliographic Notes 110

II Economics of Multidimensional Screening 111

6 The Unidimensional Screening Model 115

6.1 Spence-Mirrlees Condition and Implementability 116
 6.2 The Concept of the Information Rent 119
 6.3 Three Approaches to the Unidimensional Relaxed Problem 119
 6.3.1 The Direct Approach 119
 6.3.2 The Dual Approach 120
 6.3.3 The Hamiltonian Approach 121
 6.4 Hamiltonian Approach to the Complete Problem 122
 6.5 Type Dependent Participation Constraint 124
 6.6 Random Participation Constraint 126
 6.7 Examples 127
 6.8 Exercises 133
 6.9 Bibliographic Notes 134

7 The Multidimensional Screening Model 135

7.1 The Genericity of Exclusion 137
 7.2 Generalized Convexity and Implementability 141
 7.2.1 Is Bunching Robust in the Multidimensional Case? 143
 7.3 Path Independence of Information Rents 145
 7.4 Cost Based Tariffs 146
 7.5 Direct Approach and Its Limitations 148
 7.6 Dual Approach for $m = n$ 151
 7.6.1 The Relaxed Problem 152
 7.6.2 An Alternative Approach to the Relaxed Problem 153
 7.6.3 The Complete Problem 154
 7.6.4 The Geometry of the Participation Region 155
 7.6.5 A Sufficient Condition for Bunching 156
 7.6.6 The Extension of the Dual Approach for $n > m$ 157
 7.7 Hamiltonian Approach and the First Order Conditions 158
 7.7.1 The Economic Meaning of the Lagrange Multipliers 161
 7.8 Symmetry Analysis of the First Order Conditions 161
 7.9 The Hamiltonian Approach to the Complete Problem 166
 7.10 Examples and Economic Applications 168

7.11 Exercises	174
7.12 Bibliographic Notes	174
8 Beyond the Quasilinear Case	177
8.1 The Unidimensional Case	178
8.2 The Multidimensional Case	181
8.2.1 Implementability of a Surplus Function	182
8.2.2 Implementability of an Allocation	183
8.3 The First Order Conditions for the Relaxed Problem	186
8.4 Exercises	189
8.5 Bibliographic Notes	189
9 Existence, Uniqueness, and Continuity of the Solution	191
9.1 Existence and Uniqueness for the Relaxed Problem	191
9.2 Existence of a Solution for the Complete Problem	193
9.3 Continuity of the Solution	194
9.4 Bibliographic Notes	196
10 Conclusions	197
11 References	199
